

# Teeth-in-a-day cost

When multiple teeth are being replaced by 4 dental implants for patients who have failing teeth and broken dental caps and bridges, teeth-in-a-day cost, as of 2018, starts at about \$13,500 per arch for teeth-in-a-day temporary fixed prosthesis with all-on-four dental implants.

is indeed possible in most clinical situations.

All-on-four-dental implants with teeth-in-a-day is done when all of a patient's lower and/or upper teeth are being replaced at once by dental implants and a permanent bridge dental prosthesis. There are three main reasons that help to make this possible:

1. When 4 dental implants are used to hold a dental fixed bridge prosthesis, each implant exponentially increases the strength and stability of the new teeth.
2. The teeth-in-a-day with this type of 4 dental implants treatment involves much less healing time. This streamlines the healing process. Typically, since dental implants are placed with teeth on them immediately, a patient can expect not to need numerous visits during the healing process. This also means in certain clinical cases that there is one surgical long day, and there may be no secondary surgeries.
3. For these procedures, specific dental implants are selected to make use of all of the available bone, in order to have a relative stable and predictable outcome.

## Teeth-in-a-day with 4 dental implants treatment

A patient often come with severe bad teeth, broken dental bridges and hopeless teeth. In fact, some of them may be loose. These patients also present with continual pain, and unable to chew anything due to their poor dental condition. The vast majority of these patients have severe periodontitis, therefore, one of the best options is to remove their failing teeth, replace them with implants, eliminate the infection, and stop the bone loss

Once the teeth are removed we smooth the bone and then carefully place dental implants into the jaw. The implants integrate into the bone in the same manner as a knee or hip implants, preventing further bone loss and providing a strong foundation for the new teeth.

The process of inserting the implant is repeated for each predetermined location. Using a concept of all-on-four, which reference placing 4 dental implants and installing all the custom made fixed dental prosthesis bridge on these 4 dental implants. Since this is a single visit or a 24-hour procedure, we have to have a right material that can be easily customized to fit the newly placed dental implants in the office or the ability to deliver the final prosthesis on the next day. Therefore, we may start out with a preliminary cost-effective temporary acrylic bridge.

Once the teeth have been installed, they are strong enough to chew. During this time, a patient needs to clean around it carefully and take care to chew only soft food for about the first 3 months of healing time. This is to be sure that the 4 dental implants are able to integrate into the bone fully without becoming loose. Frequently, a patient who has been on a restricted diet due to tooth pain or a loose denture will find that the daily routine is necessary.

Many patients are able to eat a soft diet dinner the night of the procedure, and when they come back to the office for follow up appointments, they often said that the treatment offers a complete dental prosthesis solution without having to return to the office for multiple visits, bone grafting, or time spent in a denture that doesn't fit precisely, and that eating and speaking is not a problem.

able to eat a soft diet dinner procedure, and when he came follow up appointments, they was free of pain. This patients a complete dental without having to return to multiple visits, bone grafting, denture that doesn't fit moves during speech and

If patients have failing teeth, and does not want dentures and are currently wearing dentures, teeth-in-a-day treatment is a cost-effective and fast treatment that they should consider.
